

Homework 4 Submission Synopsis

Author: Hassan Hatham

Course: MIS 3371

Project: MediCare Plus - Persistent Patient Registration

Part 1: Submission Details

Specific URL: <https://hhatham8.github.io/Homework-4/homework4.html>

Theme: Persistent Medical Application (Indigo Theme)

Part 2: Project Synopsis

Homework 4 takes the advanced validation of the previous assignment and adds a layer of **session persistence** and **external content integration**.

Key Features and Logic:

- **Fetch API Integration:** The state selection dropdown is fetched dynamically from an external `states.html` file on page load.
- **iFrames:** Embedded a Medical Resources frame from Wikipedia to provide value-added content.
- **Content Protection:** Implemented a fixed header and footer using CSS `position: fixed`.
- **Cookie Tracking:** Uses a tracking cookie (expiring in 48 hours) to remember the user's first name.
- **Smart Greetings:** Returning users are greeted by name. A "Not you?" checkbox allows for data clearing.
- **Local Storage:** All non-secure form fields are saved to `localStorage` on the fly (blur/change events).

What I am particularly happy with:

I am very happy with the **Cookie/Local Storage integration**. The "Remember Me" logic is seamless; it intelligently decides whether to persist data based on the user's consent. The **fixed header** also makes the premium glassmorphism theme feel much more like a high-end web app.

What I didn't yet get working:

While the Fetch API works perfectly for local files, some external sites (like W3Schools) block iFraming due to security headers. I successfully worked around this by using Wikipedia, which allows embedding for educational purposes.
